### RESUMEN

The Llama fleece types, subjectively defined as styles, are described objectively through different types of fibres, which differentiate each other in length, thickness, type of waves, and presence-absence of lustre. Repeatability of styles and fleece types objectively defined is high. Fleece types can be redefined as double coated and single coated; lustre and hemilustre; intermediate coated as intermediate between lustre and single coated; and intermediate between single coated and double coated, respectively. The differentiation is carried out among the most representative types of fibres of each fleece type considering that the frequency of these fibre types does not influence greatly in the differentiation.
